# DYNAMIC PROGRAMMING

# **QUESTION 5.A**

## AIM:

```
Playing with Numbers:
Ram and Sita are playing with numbers by giving puzzles to each other. Now it was Ram term, so he gave Sita a positive integer 'n' and two numbers 1 and 3. He asked her to find the possible
ways by which the number n can be represented using 1 and 3. Write any efficient algorithm to find the possible ways.
Example 1:
Input: 6
Output:6
Explanation: There are 6 ways to 6 represent number with 1 and 3
    1+1+1+1+1+1
    3+3
    1+1+1+3
    1+1+3+1
     1+3+1+1
     3+1+1+1
Input Format
First Line contains the number n
Output Format
Print: The number of possible ways 'n' can be represented using 1 and 3
Sample Input
Sample Output
```

# **ALGORITHM:**

Step 1: Start

Step 2: Input an integer n

Step 3: Ini1alize an array dp of size n+1

Step 4: Set dp[0] to 1

Step 5: For each index i from 1 to n, set dp[i] to 0

Step 6: For each index i from 1 to n, do Steps 7 and 8

# **PROGRAM:**

```
Step 7: Add dp[i - 1] to dp[i]
Step 8: If i >= 3, add dp[i - 3 odp[i]
Step 9: Print dp[n] Step
10: Stop
```

```
#include<stdio.h>
int main() {
    int n;
    scanf("%d", &n);
    long dp[n+1];
    dp[0] = 1;
    for (int i = 1; i <= n; i++) {
        dp[i] = 0;
    }
    for (int i = 1; i <= n; i++) {
        dp[i] += dp[i - 1];
        if (i >= 3) {
            dp[i] += dp[i - 3];
        }
        printf("%ld\n", dp[n]);
    return 0;
}
```

# **OUTPUT:**

	Input	Expected	Got	
-	6	6	6	~
/	25	8641	8641	~
/	100	24382819596721629	24382819596721629	~

## **RESULT:**

The above program is executed successfully.

## **QUESTION 5.B**

#### AIM:

## Playing with Chessboard:

Ram is given with an n\*n chessboard with each cell with a monetary value. Ram stands at the (0,0), that the position of the top left white rook. He is been given a task to reach the bottom right black rook position (n-1, n-1) constrained that he needs to reach the position by traveling the maximum monetary path under the condition that he can only travel one step right or one step down the board. Help ram to achieve it by providing an efficient DP algorithm.

#### Example:

#### Input

3

124

234

871

#### Output:

19

#### **Explanation:**

Totally there will be 6 paths among that the optimal is

Optimal path value:1+2+8+7+1=19

#### Input Format

First Line contains the integer n

The next n lines contain the n\*n chessboard values

#### **Output Format**

Print Maximum monetary value of the path

# **ALGORITHM:**

Step 1: Start

Step 2: Input an integer n

Step 3: Ini1alize a 2D array board of size n x n

Step 4: For each row i from 0 to n-1, and each column j from to n-1, input board[i][j]

Step 5: Call maxMonetaryPath(n, board) and store the results int

Step 6: Print result Step

7: Stop

# Func%on maxMonetaryPath(n, board):

Step 1: Ini1alize a 2D array dp of size nxn

Step 2: Set dp[0][0] toboard[0][0]

Step 3: For each column from to n-1, set dp[0][j] = dp[0][j-1] + board[0][j]

Step 4: For each row i from to n-1, set dp[i][0] = dp[i-1][0] + board[i][0]

Step 5: For each row i from to n-1, and each column from to n-1, set dp[i][j] = board[i][j] + max(dp[i-1][j], dp[i][j-1])

Step 6: Return dp[n-1][n-1]

```
#include<stdio.h>
int max(int a,int b) {
    return(a>b) ? a:b;
int maxMonetaryPath(int n,int board[n][n]){
    int dp[n][n];
    dp[0][0]=board[0][0];
     for(int j=1;j<n;j++){
         dp[0][j]=dp[0][j-1]+board[0][j];
    for (int i=1;i<n;i++) {
    dp[i][0]=dp[i-1][0]+board[i][0];</pre>
    for (int i=1;i<n;i++) {
         for (int j=1;j<n;j++) {
    dp[i][j]=board[i][j]+max(dp[i-1][j],dp[i][j-1]);</pre>
    return dp[n-1][n-1];
int main(){
    int n;
scanf("%d",&n);
    int board[n][n];
    for (int i=0;i<n;i++){
    for (int j=0;j<n;j++){
        scanf("%d",&board[i][j]);
    int result=maxMonetaryPath(n,board);
    printf("%d\n",result);
```

## **OUTPUT:**

	Input	Expected	Got	
~	3	19	19	~
	1 2 4			
	2 3 4			
	8 7 1			
~	3	12	12	~
	1 3 1			
	1 5 1			
	4 2 1			
~	4	28	28	~
	1 1 3 4			
	1 5 7 8			
	2 3 4 6			
	1690			

## **RESULT:**

The above program is executed successfully.

## **QUESTION 5.C AIM**

:

# **ALGORITHM:**

```
Step 1: Start Step 2: Input two strings _{s1} and _{s2} Step 3: Calculate the lengths _{len1} of _{s1} and _{len2} of _{s2} Step 4: IniBalize a 2D array _{dp} of size _{(len1\ +\ 1)} \times _{(len2\ +\ 1)} Step 5: For each index from to _{len1}, and each index from to _{len2}, do Steps 6-8 Step 6: If _{i=0} or _{j=0}, set _{dp[i][j]=0} Step 7: If _{s1[i-1]}=_{s2[j-1]}, set _{dp[i][j]}=_{dp[i-1][j-1]}+_{1} Step 8: Otherwise, set _{dp[i][j]} to the maximum of _{dp[i][j-1]} and _{dp[i-1][j]} Step 9: Print _{dp[len1][len2]} Step 10: Stop
```

# **PROGRAM:**

## **OUTPUT:**

	Input	Expected	Got	
~	aab azb	2	2	~
~	ABCD ABCD	4	4	~

# **RESULT:**

The above program is executed successfully.

## **QUESTION 5.D**

## AIM:

Problem statement:

Find the length of the Longest Non-decreasing Subsequence in a given Sequence.

Eg:

Input:9

Sequence:[-1,3,4,5,2,2,2,2,3]

the subsequence is [-1,2,2,2,2,3]

Output:6

## **ALGORITHM:**

Step 1: Start

Step 2: Input an integer n

Step 3: Ini1alize an array arr of size n

Step 4: For each index i from 0 to n-1, input arr[i]

Step 5: Call subsequence(arr, n) and store the resulterult

Step 6: Print result Step

7: Stop

# Func%on subsequence(arr, n):

Step 1: Ini1alize an array dp of size n

Step 2: Set each element in dp to 1

Step 3: Ini1alize maxlen to 1

Step 4: For each index i from 1 to n-1, do Steps 5-7

Step 5: For each index j from 0 to i-1, if arr[i] >= arr[j] and e[i] < dp[j] + 1, set dp[i] = dp[j] + 1

Step 6: If maxlen < dp[i], set maxlen = dp[i] Step

7: Return maxlen

## **PROGRAM:**

```
#include <stdio.h>
int subsequence(int arr[],int n){
    int dp[n];
    int maxlen=1;
    for (int i=0; i< n; i++){
         dp[i]=1;
    for (int i=1;i<n;i++){
   for(int j=0;j<i;j++){
     if(arr[i]>=arr[j] && dp[i]<dp[j]+1){</pre>
                    dp[i]=dp[j]+1;
          if(maxlen<dp[i]){
              maxlen=dp[i];
    return maxlen;
int main(){
    int n;
scanf("%d",&n);
    int arr[n];
    for (int i=0;i<n;i++){
    scanf("%d",&arr[i]);</pre>
    int result=subsequence(arr,n);
    printf("%d",result);
```

# **OUTPUT:**

	Input	Expected	Got	
~	9 -1 3 4 5 2 2 2 2 3	6	6	~
/	7 1 2 2 4 5 7 6	6	6	~

## **RESULT:**

The above program is executed successfully.
